

DRaaS from Leaseweb

Disaster Recovery as a Service

Disaster Recovery as a Service (DRaaS) from Leaseweb provides business continuity when failure occurs in primary data center. It's an "almost-synchronous" replication system of virtual servers, used to protect applications and data from disruption caused by a disaster.

Main features and benefits:

- One stop shop solution: Our reliable VMware cloud platform is deployed in two separate data centers and fiber-connected to our trusted disaster recovery solution
- Top tier replication software from Zerto with its near zero RPO* to minimize data loss when a disaster occurs
- Seamless integration in our private cloud solution to guarantee a successful continuous replication
- Freedom of choice: You decide which virtual servers need to be replicated in the secondary data center location
- Installation and management of disaster recovery software environment by Leaseweb, including patches and updates, with a total control over the replication and orchestration process
- Automated tooling with agentless replication software: No complicated setup or maintenance schedules and no need to modify your virtual machines' configuration

* RPO (Recovery Point Objective): The amount of data loss in case of a failure

Our Solution

The price per VM includes connectivity and data transfer between two sites.
